ABSTRACT:

Here the communication of the system based on the well defined co operative strategy under which it is related to the interest of the user is a major concern in the form of the customer based perspective related to the environment o the wireless strategy is a major concern respectively. There are a number of the previously defined method under which it is related to the design based specifications of the issues related to the strategy of the physical layer followed by the well effective design based aspect of the scenario related to the link is of the major focus respectively. Here under the communication based strategy under which the system is related to the design based parameters where it is oriented in terms of the co operative strategy under which there is an issue under the upper layer under the network based strategy is a major concern. Here some of the issues of the system based strategy includes the controlled topology, capacity of the network and the following routing, are been ignored under it. Here a ne technique is proposed by the powerful mechanism under which it designed by the help of the topology of the co operative optimized capacitance with respect to the scheme of the control based strategy followed by the capacity of the network base improvement under the accurate design of the phenomena of the MANET's is a major concern respectively. Where it is well oriented with respect to the network base constraints of the lay of the upper strategy followed by the layer of the physical co operative

strategy where it is related to the well effective design based parameters under the capacity of the network based impact is a major concern respectively. Where it is done by the help of the effective powerful mechanism of the MANET's is a major concern. Experiments have been conducted on the present method where the accuracy of the system is a major concern for the purpose of the verification of the performance of the entire outcome of the system in a well effective manner respectively. Here the performance of the present designed method must be more accurate than of the conventional methods then we can say that the present designed method is efficient in its implementation strategy respectively.

KEYWORDS: *Virtual machines, communication of the wireless environment, Evolution of the long terms strategy, project of the generation partnership, MANET's, co operative optimized capacity and control of topology routing respectively.*

1. INTRODUCTION:

Here under the network based constraints of the wireless phenomena where there is an improvement in the speed of the demand are increasing respectively. Here under the implementation of the communication system under the scenario of the wireless scenario where it includes the well effective strategy of the design based parameters under the co operative strategy where there is a lot of interest takes place in the system in terms of the performance improvement under the operating transmission phenomena where there is a huge challenge for the system based aspect under the well effective analysis of the system under the untapped

environment based constraints respectively [1][2]. Here the emerging of the communication based on the strategy of the co operative basis where there is proper maintenance of the diversity under the new dimensional constraints under the design oriented strategy of the emulation based on the designed system of the multiple antennas under the environment of the wireless basis related to the starter of the mobile communication where they are unable to transmits the data with respect to the antennas where there is a limitation of the size, cost followed by the scenario of the design pays a major role in its applicability respectively [3][4]. There is a lot of exploration under the channel of the wireless

nature broadcasting of the communication based on the cob operative strategy in which there is an allowance of the radiation of the single antenna strategy where the sharing is done on the array oriented virtualized basis and the improvement in the performance plays a crucial role in the system based aspect respectively. Here the complete implementation of the system takes place n the well respective standards of the IEEE by the scenario of the 802.16 under the integrated expectation of the well designed phenomena related to the project of the generation partnership under the evolution of the long term strategy which is interrelated to the cellular network of the multi hop phenomena respectively.

BLOCK DIAGRAM

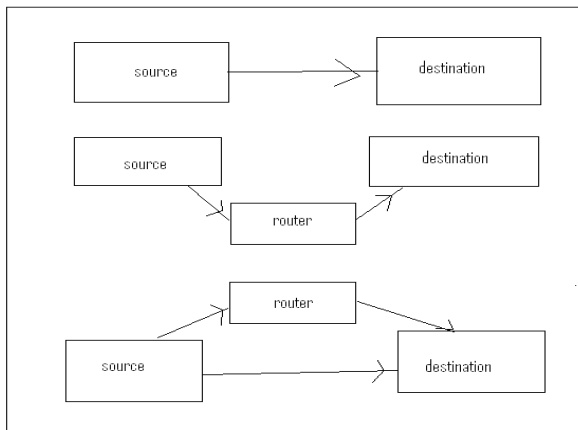

Fig 1: Shows the block diagram of the present method respectively

2. METHODOLOGY:

Here the implementation of the present method is designed by a powerful mechanism under which there is a lot of improvement takes place in the system as of the compared to the several previous conventional methods in a well oriented fashion respectively [5][6]. Here the implementation of the present method is shown by the above figure in the form of the block diagram and is explained in a brief summarized fashion respectively. There is a huge research take place at the time of the design of the MANET's under which environment based constraints of the communication oriented strategy of the co operative basis and there is an integration of the well effective design of the system based strategy in terms of the major concentration of the issues of the layer under the standards of the physical phenomena followed by the layer of the aspect included with the link based constraints which includes the capacity followed by the probability of the outages respectively [7][8]. There are some of the issues that are interrelated to the well effective design based phenomena under which impact oriented in terms o the layer o the network under the communication of the co operative strategy plays a crucial role I its

applicability point of view where it includes the control of the topology, capacity of the network based constraints are ignored respectively. Here under the links of the wireless based network under which there is a chance of the adapt create and manage the scenario of the under the network well oriented in terms of the point point communication plays a crucial role in its application point of view respectively. Here the architectures are implemented under such strategy where there is a well effective design of the system based constraints involvement takes place under the links of the smile networks followed by the complexity of the system involvement plays a crucial role in well efficient manner respectively.

3. EXPECTED RESULTS:

The above graphical representation briefly illustrates and shows the difference between the present methods to that of the conventional method in a well efficient manner under which there is a lot of improvement takes place in the system with respect to the design oriented analysis of the present method in a well efficient manner respectively. Here the design of the present method completely overcomes the

drawbacks of the several previous methods in a well efficient manner respectively. Here in the implementation of the conventional methods under which there is a lack of the scenario of the communication under the strategy of the co operative basis under the link of the neighbor oriented strategy which plays a crucial role in its application point of view respectively.

4. CONCLUSION:

In this paper a new technique is proposed based on the design oriented mechanism of the MANET's under the co operative communication of the physical layer followed by the control of the topology under the capacity of the networks respectively. For the further improvement in the capacity of the network under the communication of the co operative basis of the MANET based implementation where the present designed method is implementation of the well effective topology of the co operative optimized capacity where the scheme includes the controlled strategy under the network capacity of the upper and the physical layer plays a crucial role in its application perspective respectively.
